

Data Availability Statement

The replication materials for this paper draw on both restricted administrative microdata and publicly available macroeconomic datasets.

Restricted data. The firm-level balance sheet data used in the empirical analysis (stored as `firm_appended.dta`) originate from the tax return records of Hungary’s National Tax and Customs Administration (NAV, formerly APEH), harmonized by the ELTE KRTK Databank (Hungarian Academy of Sciences, Centre for Economic and Regional Studies). Access to this dataset is governed by data-sharing agreements with the data owner and can be obtained through the ELTE KRTK Databank upon application. Researchers wishing to replicate the firm-level empirical results should contact the ELTE KRTK Databank directly regarding access conditions.

Publicly available data. All remaining data used in this paper are publicly accessible. Country-level aggregate data are drawn from the World Bank World Development Indicators (WDI), the World Bank World Integrated Trade Solution (WITS) database, the Bank for International Settlements (BIS) total credit statistics, the Trade in Value Added (TiVA) database of the Organisation for Economic Co-operation and Development (OECD), the Penn World Table version 7.1 [Heston, Summers, and Aten, 2012], and the Chinn-Ito [2006] capital account openness index. Hungarian aggregate fiscal data (import tariff revenues) are drawn from official Hungarian State Budget Execution Reports (*Magyar Állami Zárészámadás*), accessible via the Hungarian legal database at net.jogtar.hu. World Inequality Database (WID) income share series are available at wid.world.

Replication code. The Julia code required to reproduce all model-based figures and tables is available in the online appendix at https://github.com/l1245/trade_misallocation_capital_appendix. Stata do-files for the empirical analysis can be provided upon request; their execution requires access to the restricted ELTE KRTK firm-level dataset described above.
